1. What is a form?

A form is a container used to collect user input. We use it to send data from a visitor's browser to a server.

2. What is input element is the most versatile form element. Depending on its type attribute, it can be text field, a checkbox a radio button or submit button. It is used actually receive the data from the user.

3. What are select and option?

Select: Creates a drop-down list. We use it when we want to provide multiple choices in a compact space.

Option: Defines the individual items inside that drop-down list.

4. What is the use of value.

The value attribute serves two main purposes:

* For buttons: It defines the text shown on the button (eg: "submit").

* For inputs/options: It defines the specific data sent to the server when the form is submitted.

5. What is Label and Placeholder.

* Label provides a permanent caption for an element. It crucial for accessibility and allows users to click the text.

* Placeholder: Provides a temporary hint inside the input box. It disappears as soon as the user starts typing.
